

OPEN_SOURCE_INTENT.md

Open-Source Intent & Collaboration Direction

Why Open Infrastructure Matters

Climate vulnerability and fragile livelihood systems require collaborative and adaptable resilience infrastructure.

ICDS is being developed toward:

- transparent validation systems,
- interoperable resilience intelligence,
- and scalable anticipatory decision-support infrastructure for vulnerable enterprise ecosystems.

Intended Open-Source Principles

The project aims to support:

- transparency,
- ecosystem interoperability,
- responsible adaptation,
- collaborative learning,
- and scalable resilience intelligence deployment.

Intended License Direction

Current licensing pathways under exploration include:

- Apache 2.0

- MIT License
- Hybrid open-core structures

Final decisions will prioritise:

- accessibility,
- responsible implementation,
- sustainability,
- and ecosystem collaboration.

Ecosystem Use Cases

Potential deployment environments include:

- MSME resilience programmes
- Climate adaptation systems
- Disaster risk reduction initiatives
- Youth innovation ecosystems
- Community livelihood stabilisation programmes
- Humanitarian anticipatory action systems

Collaboration Roadmap

CRI seeks collaboration with:

- resilience researchers,
- open-source contributors,
- climate innovation ecosystems,
- humanitarian actors,
- development finance institutions,
- and anticipatory action initiatives.

The long-term vision is to contribute toward a shared resilience intelligence ecosystem capable of improving how vulnerable systems are identified and supported before collapse occurs.
